Perhaps nothing in American politics is more trivial or more ruinous than talk radio. What is the point of a two-hour-long national radio broadcast in which a single politician, from either party, is asked a question and then responds with 45 seconds of argument for 45 minutes? The candidate has done nothing. But the conservative talker has done something. He has incited an ungrateful electorate to vote against itself. An opposing party usually has the most rabid followers. But Donald Trump's supporters, though usually less excitable than the fans of other Republican candidates, are far more passionate, and highly vocal. And as he has lurched through the early stages of his campaign, I have listened to them on his behalf, often filled with exasperation and anger at their candidate, whom they regard as a fraud. The talk-radio audience is the most enthusiastic but also the most diverse. And for more than a year, I have heard them talk about their candidate. To get the most out of these people, I have relied on a unique tool in my investigation of Trump: a recording of their previous radio exchanges, or "playbacks," as the producers call them. The playbacks, which have been provided by Salem Media Group, an organization that hosts about 1,400 conservative talk-radio shows, cover the entire gamut of conservative-talk radio from Rush Limbaugh to Mark Levin. They provide access to a rich archive of inside the Trump camp. In my previous work, I have relied on these playbacks to understand Republican voters' attitudes toward social security and Obamacare and to see how they have reacted to Hillary Clinton's record as a senator.Q: In Scala, is it more efficient to instantiate a function class using a method reference or a lambda? In Scala, is it more efficient to instantiate a function class using a method reference or a lambda? I am asking this because I would like to create a generic function that allows me to assign the function class by a lambda or by a method reference. To help clarify: object LongLastFunction { def lastLong(x: Int): Long = { var longLastValue = 0L while (x > 0) { longLastValue = longLastValue + x x = x - 1 } longLastValue }
